***Lighting the Way to Fusion***

## Outline

---

- **Objectives for a Next Step Experiment in Magnetic Fusion**
- **Burning Plasma Performance Considerations**
- **Compact High Field Approach - General Parameters**
- **Advanced Tokamak Longer Pulse Possibilities**
- **Summary**

# Is Fusion a Possible Energy Source?

---

- Fusion would be an ideal long term energy source – the natural energy source
- “Fusion, energy of the future, always has been, always will be.”
- How much will it cost to find out?

Spent ~\$10B on MFE in the U.S. during the past 50 years.

- What must be done to make a convincing case?

Address the critics

# The Grand Challenge, Science and Technology for Fusion

## Key Plasma Performance Metrics

- **Fusion Gain ( $Q_p$ )**
- Fusion Energy Density
- Duty Cycle/Repetition Rate

## Key Engineering Metrics

- **First Wall Lifetime**
- Availability/Reliability
- Environment and Safety
- System Costs

# Critical Issues to be Addressed in the Next Stage of Fusion Research

---

- **Burning Plasma Physics**
    - strong nonlinear coupling inherent in a fusion dominated plasma
    - access, explore and understand fusion dominated plasmas
  - **Advanced Toroidal Physics**
    - develop and test physics needed for an attractive MFE reactor
    - couple with burning plasma physics
  - **Boundary Physics and Plasma Technology** (coupled with above)
    - high particle and heat flux
    - couple core and divertor
    - fusion plasma - tritium inventory and helium pumping
  - **Neutron Resistant Materials** (separate facility)
    - high fluence testing using “point”neutron source
- 
- Superconducting Coil Technology does not have to be coupled to physics experiments - only if needed for physics objectives
  - Nuclear Component Testing should wait for the correct reactor materials

# The Multi-Machine Strategy for Magnetic Fusion

(The overall Multi-Machine Strategy includes IFE)

# Plasma Requirements for a Burning Plasma

---

## Power Balance

$$P_{\text{aux-heat}} + n^2 \langle \sigma v \rangle U_{\alpha} V_p / 4 - C_B T^{1/2} n_e^2 V_p = 3nkTV_p / \tau_E + d(3nkTV_p) / dt$$

where:  $n_D = n_T = n_e / 2 = n / 2$ ,  $n^2 \langle \sigma v \rangle U_{\alpha} V_p / 4 = P_{\alpha}$  is the alpha heating power,  $C_B T^{1/2} n_e^2 V_p$  is the radiation loss,  $W_p = 3nkTV_p$  and  $\tau_E = W_p / (P_{\text{aux-heat}} - dW_p / dt)$  is the energy confinement time.

## In Steady-state:

$$n\tau_E = \frac{3kT}{\langle \sigma v \rangle U_{\alpha} (Q+5)/4Q - C_B T^{1/2}}$$

where  $Q = P_{\text{fusion}} / P_{\text{aux-heat}}$

$Q = 1$  is Plasma Breakeven,  $Q = \infty$  is Plasma Ignition

# Status of Laboratory Fusion Experiments

# Fusion Science Objectives for a Major Next Step Burning Plasma Experiment

---

**Explore and understand the strong non-linear coupling that is fundamental to fusion-dominated plasma behavior (self-organization)**

- Energy and particle transport (extend confinement predictability)
  - Macroscopic stability (  $\beta$ -limit, wall stabilization, NTMs)
  - Wave-particle interactions (fast alpha particle driven effects)
  - Plasma boundary (density limit, power and particle flow)
- Test/Develop techniques to control and optimize fusion-dominated plasmas.
  - Sustain fusion-dominated plasmas - high-power-density exhaust of plasma particles and energy, alpha ash exhaust, study effects of profile evolution due to alpha heating on macro stability, transport barriers and energetic particle modes.
  - Explore and understand various advanced operating modes and configurations in fusion-dominated plasmas to provide generic knowledge for fusion and non-fusion plasma science, and to provide a foundation for attractive fusion applications.

# Advanced Burning Plasma Exp't Requirements

---

## Burning Plasma Physics

$Q \geq 5$ ,  $\sim 10$  as target, ignition not precluded

$f_\alpha = P_\alpha/P_{\text{heat}} \geq 50\%$ ,  $\sim 66\%$  as target, up to 83% at  $Q = 25$

TAE/EPM stable at nominal point, able to access unstable

## Advanced Toroidal Physics

$f_{\text{bs}} = I_{\text{bs}}/I_p \geq 50\%$  up to 75%

$\beta_N \sim 2.5$ , no wall  $\sim 3.6$ ,  $n = 1$  wall stabilized

## Quasi-stationary

Pressure profile evolution and burn control  $> 10 \tau_E$

Alpha ash accumulation/pumping  $> \text{several } \tau_{\text{He}}$

Plasma current profile evolution 1 to 3  $\tau_{\text{skin}}$

Divertor pumping and heat removal several  $\tau_{\text{divertor}}, \tau_{\text{first wall}}$

# Stepping Stones for Resolving the Critical Fusion Plasma Science Issues for an Attractive MFE Reactor

The Modular or Multi-Machine Strategy.

# Guidelines for Estimating Plasma Performance

---

**Confinement (Elmy H-mode) - ITER98(y,2) based on today's data base**

$$\tau_E = 0.144 I^{0.93} R^{1.39} a^{0.58} n_{20}^{0.41} B^{0.15} A_i^{0.19} \kappa^{0.78} P_{\text{heat}}^{-0.69} H(y,2)$$

**Density Limit - Based on today's tokamak data base**

$$n_{20} \leq 0.8 n_{\text{GW}} = 0.8 I_p / \pi a^2,$$

**Beta Limit - theory and tokamak data base**

$$\beta \leq \beta_N(I_p/aB), \quad \beta_N < 2.5 \text{ conventional}, \quad \beta_N \sim 4 \text{ advanced}$$

**H-Mode Power Threshold - Based on today's tokamak data base**

$$P_{\text{th}} \geq (2.84/A_i) n_{20}^{0.58} B^{0.82} Ra^{0.81}, \quad \text{same as ITER-FEAT}$$

**Helium Ash Confinement  $\tau_{\text{He}} = 5 \tau_E$ , impurities = 3% Be, 0% W**

**Understanding is mainly empirical. Better understanding is needed from existing experiments with improved simulations, and a benchmark in alpha-dominated fusion plasmas is needed to confirm and extend the science basis.**

# Optimization of a Burning Plasma Experiment

- Consider an inductively driven tokamak with copper alloy TF and PF coils precooled to LN temperature that warm up adiabatically during the pulse.
- Seek minimum R while varying A and space allocation for TF/PF coils for a specified plasma performance - Q and pulse length with physics and eng. limits.

What is the optimum for advanced steady-state modes?

# Fusion Ignition Research Experiment

## (FIRE)

<http://fire.pppl.gov>

### Design Features

- $R = 2.14 \text{ m}$ ,  $a = 0.595 \text{ m}$
- $B = 10 \text{ T}$
- $W_{\text{mag}} = 5.2 \text{ GJ}$
- $I_p = 7.7 \text{ MA}$
- $P_{\text{aux}} \leq 20 \text{ MW}$
- $Q \approx 10$ ,  $P_{\text{fusion}} \sim 150 \text{ MW}$
- Burn Time  $\approx 20 \text{ s}$
- Tokamak Cost  $\approx \$375\text{M}$  (FY99)
- Total Project Cost  $\approx \$1.2\text{B}$  at Green Field site.

### Mission:

Attain, explore, understand and optimize fusion-dominated plasmas.

$$\beta \leq \beta_N(I_p/aB), \quad \beta_N < 2.5 \text{ conventional}, \quad \beta_N \sim 4 \text{ advanced}$$

**H-Mode Power Threshold - Based on today's tokamak data base**

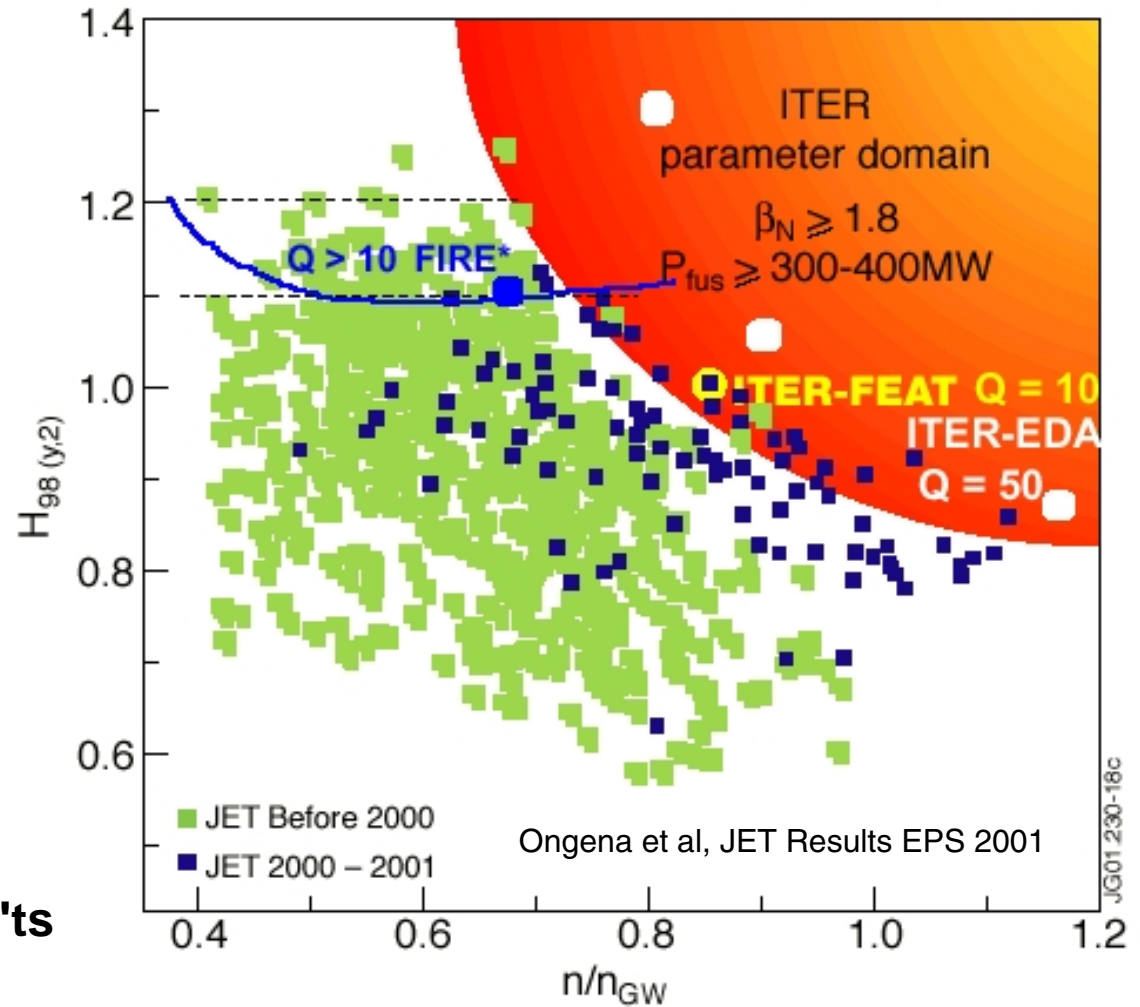

$$P_{\text{th}} \geq (2.84/A_i) n_{20}^{0.58} B^{0.82} Ra^{0.81}, \quad \text{same as ITER-FEAT}$$

**Helium Ash Confinement  $\tau_{\text{He}} = 5 \tau_E$ , impurities = 3% Be, 0% W**

**Understanding is mainly empirical. Better understanding is needed from existing experiments with improved simulations, and a benchmark in alpha-dominated fusion plasmas is needed to confirm and extend the science basis.**

# FIRE's Operating Density and Triangularity are Near the Optimum for the Elmy H-Mode

- The optimum density for the H-Mode is  $n/n_{GW} \approx 0.6 - 0.7$
- H-mode confinement increases with  $\delta$ 
  - $\delta \approx 0.7$  FIRE
  - $\delta \approx 0.5$  ITER-FEAT
- Elm size is reduced for  $\delta > 0.5$
- $Z_{eff}$  decreases with density (Mathews/ITER scaling)
- DN versus SN ? C- Mod Exp'ts

Cordey et al, H = function (  $\delta$ ,  $n/n_{GW}$ ,  $n(0)/\langle n \rangle$ ) EPS 2001

# Projections to FIRE Compared to Envisioned Reactors

## Physics Based Transport Model

# GLF23 Transport Model With Real Geometry ExB Shear Shows Improved Agreement With L- and H-mode and ITB Profile Database

- Statistics computed incremental stored energy (subtracting pedestal region) using exactly same model used for ITB simulations

\*  $T_e, T_i, v_\phi$   
predicted for ITBs

## ***Pedestal Temperature Requirements for Q=10***

UFA BPS Workshop 2

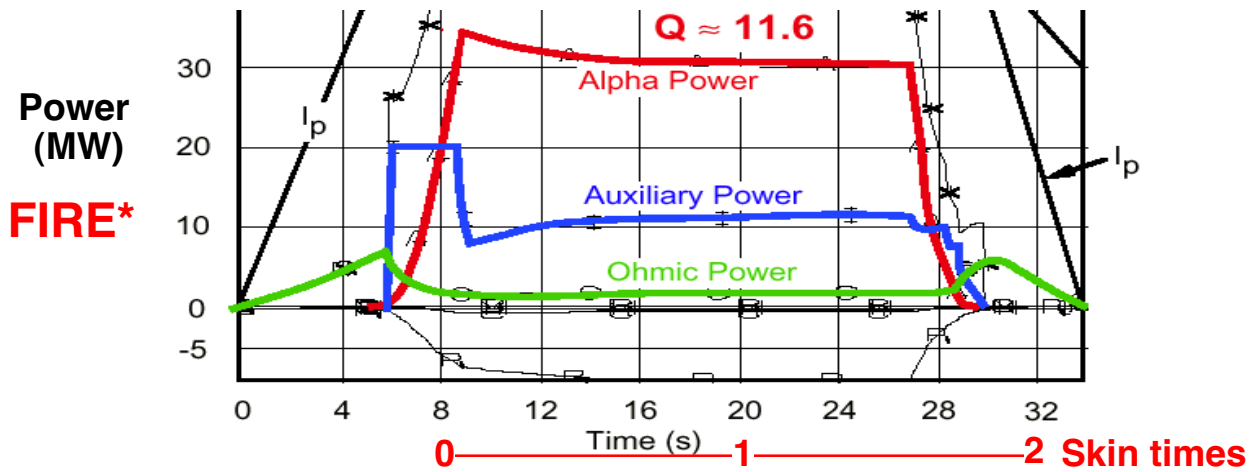

# 1 1/2-D Simulation of Burn Control in FIRE\* (TSC)

- ITER98(y,2) scaling with  $H(y,2) = 1.1$ ,  $n(0)/\langle n \rangle = 1.2$ , and  $n/n_{GW} = 0.67$
- Burn Time  $\approx 20 \text{ s} \approx 21 \tau_E \approx 4 \tau_{He} \approx 2 \tau_{skin}$

$$Q = P_{fusion}/(P_{aux} + P_{oh})$$

# Normalized Burn Time (Plasma Skin Time)

Waveforms from talks presented at UFA BPS Workshop 2

# FIRE could Access the “Long Pulse” Advanced Tokamak Mode Frontier at Reduced Toroidal Field.

Note: FIRE is  $\approx$  the same physical size as TPX and KSTAR.

At  $Q = 10$  parameters, typical skin time in FIRE is 13 s and is 200 s in ITER-FEAT .

The Number of Skin Times curve assumes a constant skin time of 13s.

**The main limit to long pulses is the divertor and first wall  
- a generic problem for magnetic fusion.**

# **FIRE** is Pursuing Burning **A**dvanced Tokamak Plasmas

---

- High potential benefits of Advanced Tokamak operation make AT research mandatory on any Burning Plasma Experiment ([Snowmass 1999](#))
- ARIES Power Plant studies show that AT plasmas provide
  - High  $\beta$  ----> high fusion power density
  - Large bootstrap (self-driven) current and good alignment ----> low recirculating power
  - Good plasma confinement consistent with high  $\beta$  and high bootstrap current ----> high fusion gain Q
  - This combination drives down the machine size and the cost of electricity (COE)
- **FIRE** must demonstrate that these plasmas can be established and maintained in a stationary state

# **FIRE** Has Adopted the **AT** Features Identified by **ARIES** Studies

---

- High toroidal field
- Double null
- **Strong shaping**
  - $\kappa = 2.0, \delta = 0.7$
- **Internal** vertical position control coils
- Cu **wall stabilizers** for vertical and kink instabilities
- Very **low ripple** (0.3%)
- **ICRF/FW** on-axis CD
- **LH** off-axis CD
- LHCD stabilization of NTMs
- **Tungsten divertor** targets
- **Feedback** coil stabilization of **RWMs**
- Burn times exceeding **current diffusion times**
- Pumped divertor/pellet fueling/impurity control to **optimize plasma edge**

# FIRE can Test Advanced Modes Used in Advanced Reactor Designs

# TSC Simulation of a "Fusion Dominated" Plasma

8.5 T, 5.4 MA,  $t(\text{flattop}) = 32$  s

$H(y,2) = 1.6,$   
 $\beta_N = 3.5, \quad n(0)/\langle n \rangle = 1.5$

## **Contributors to the FIRE Engineering Design Study**

# TF Conductor Material for FIRE is “Essentially” Available

---

- BeCu alloy C 17510 - 68% IACS is now a commercial product for Brush Wellman.
- A relatively small R&D program is needed to assure that the plates will be available in the properties and sizes required.

The plate on the right was manufactured for BPX

# **Edge Physics and PFC Technology: Critical Issue for Fusion**

---

Plasma Power and particle Handling under relevant conditions  
Normal Operation / Off Normal events

Tritium Inventory Control  
must maintain low T inventory in the vessel  $\Rightarrow$  all metal PFCs

Efficient particle Fueling  
pellet injection needed for deep and tritium efficient fueling

Helium Ash Removal  
need close coupled He pumping

Non-linear Coupling with Core plasma Performance  
nearly every advancement in confinement can be traced to the edge  
Edge Pedestal models first introduced in  $\sim$  1992 first step in understanding  
Core plasma (low  $n_{\text{edge}}$ ) and divertor (high  $n_{\text{edge}}$ ) requirements conflict

**Solutions to these issues would be a major output from a next step experiment.**

AR RS/ITERs/PCAST/FIRE/IGN

# Timetable for “Burn to Learn” Phase of Fusion

- Even with ITER, the MFE program will be unable to address the alpha-dominated burning plasma issues for  $\geq 15$  years.
- Compact High-Field Tokamak Burning Plasma Experiment(s) would be a natural extension of the ongoing “advanced” tokamak program and could begin alpha-dominated experiments by  $\sim 10$  years.
- **More than one high gain burning plasma facility is needed in the world program.**
- The Snowmass 2002 Summer Study will provide a forum to assessing approaches. The NRC Review in 2002 will assess contributions to broader science issues..

## Summary

---

- A Window of Opportunity may be opening for U.S. Energy R&D. We should be ready. The Modular or Multi-Machine Strategy has advantages for addressing the science and technology issues of fusion.
- FIRE with a construction cost ~ \$1B, has the potential to :
  - address the important burning plasma issues, performance ~ ITER
  - investigate the strong non-linear coupling between BP and AT,
  - stimulate the development of reactor relevant PFC technology, and
  - provide generic BP science and possibly BP infrastructure for non-tokamak BP experiments in the U. S.
- Some areas that need additional work to realize this potential include:
  - Apply recent enhanced confinement and advanced modes to FIRE
  - Understand conditions for enhanced confinement regimes
  - Compare DN relative to SN - confinement, stability, divertor, etc
  - Complete disruption analysis, develop better disruption control/mitigation.
- If a positive decision is made in this year, FIRE is ready to begin Conceptual Design in FY2003 with target of first plasmas ~ 2010.
