

APS Public Affairs Forum, April 5, 2003:
International Science and Large Scale Facilities

-

The International Linear Collider:
The need for Global collaboration

Maury Tigner
Cornell University

- A. The scientific challenges of particle physics today
- B. What is a linear collider?
- C. Why must it be international?
- D. History of collaboration in ILC
- E. Status of the collaboration today/ future plans

A. Scientific Frontiers

- *Origin of mass*
- *Mechanism of electroweak symmetry breaking*
- *Is supersymmetry a feature of our universe*
- *What is dark matter; dark energy*
- *Can the universe be described with 4 dimensions...*

As the universe cooled after the big bang the nature of the interactions taking place changed in ways characteristic of the prevailing temperature . If we could recreate these conditions and study the elementary interactions in the lab, we should be able to find answers  *particle accelerators*

- Today, the frontier of Energy ("temperature") is at about 2 TeV, colliding protons against anti-protons at FNAL in the "Tevatron" a superconducting storage ring
- In ~ 2007 the LHC (Large Hadron Collider) at CERN will come on with capability for ~14 TeV, colliding protons with protons. (*protons are composite particles sharing the energy so that the elementary collision energies are ~ 1/10 total*)

- Important parts of the questions listed above will be addressed by the LHC. It is now widely agreed[†] that obtaining the complete picture will require a machine colliding monochromatic elementary particles, in this case electrons and positrons. To avoid the enormous synchrotron radiation that would inhere in a storage ring for e^+ and e^- at TeV energies, one must accelerate in a straight line - hence a "Linear Collider"

[†] *Formal studies in Asia, Europe and US*

B. What is a linear collider?

Electrons on positrons

SLC

: the first linear collider

- Built in 1988 at SLAC
- $E_{CM}=92\text{GeV}$
- Use **one common linac** for electron and positron
- Provided sufficient luminosity for Z^0 with beam size $\lesssim 1\mu\text{m}$
- Precious experience for future LC

JLC Complex

C. Why international?

- * If there is one to be - there will only be one to be shared by the world community  world community should share in the concept, realization and harvesting of science
- * Pooling of resources - intellectual and economic - needed for realization of such a large project today

D. History of Collaboration - combination of grass roots and more formal activities

- Communities in Russia, Asia, Europe and US began work in early '90s - began formal exchanges soon thereafter in a series of workshops - first one LC1993 - reached

agreement on a common set of parameters to enable inter-comparison of the various schemes being developed. *Very beneficial and still going on.*

- In 1993 a collaboration of the principal actors from the various regions created a Collaboration Council to facilitate collaborations and technical developments. In 1994 they created a Technical Review Committee, TRC,*The TRC is to identify the accelerator physics and technological requirements for each approach to provide particle physics opportunities at the energy and luminosity goals agreed upon. The report of the TRC should contain a brief commentary of the status and expected progress toward understanding and achieving the most important of these requirements.....*

The TRC report was presented to a Collaboration Council meeting in Japan in 1995.

- The work in the several regions was collaborative from the beginning as well as shown by these illustrative mastheads adopted by the various groups (see Fig 1 & 2)

E. Status of the collaboration today/ future plans

- In the intervening years, the number of approaches has reduced to ~ 2 owing to economic and other factors.

The involved scientific community is now driving towards selecting one of those approaches and coalescing into one global collaboration.

World-Wide Collaboration on X-Band

• Stanford • UC Davis

Fermilab

• British Columbia

• Oxford

• BINP

Members of the TESLA Collaboration

	Yerevan Physics Institute, Yerevan		Laboratori Nazionali di Frascati, INFN, Frascati
	Institute for High Energy Physics (IHEP), Academia Sinica, Beijing		Istituto Nazionale di Fisica Nucleare (INFN), Legnaro
	Tsinghua University, Beijing		Istituto Nazionale di Fisica Nucleare (INFN), Milan
	Centro de Investigaciones Energéticas, Medioambientales y Tecnológicas (CIEMAT), Madrid		Istituto Nazionale di Fisica Nucleare (INFN), Rome II
	Institute of Physics, Helsinki		Institute of Nuclear Physics, Cracow
	CEA/DSM DAPNIA, CE-Saclay, Gif-sur-Yvette		University of Mining and Metallurgy, Cracow
	Laboratoire de l'Accélérateur Linéaire (LAL), IN2P3, Orsay		Soltan Institute for Nuclear Studies, Otwock-Swierk
	Institut de Physique Nucléaire (IPN), Orsay		High Pressure Research Center, Polish Academy of Science, Warsaw
	Rheinisch-Westfälische Technische Hochschule, Aachen		Institute of Physics, Polish Academy of Science, Warsaw
	Berliner Elektronenspeicherring-Gesellschaft für Synchrotronstrahlung, BESSY, Berlin		Polish Atomic Energy Agency, Warsaw
	Hahn-Meitner Institut Berlin		Faculty of Physics, University of Warsaw
	Max-Born-Institut, Berlin		Moscow Engineering and Physics Institute, Moscow
	Technische Universität Berlin		Budker Institute for Nuclear Physics (BINP), Novosibirsk
	Technische Universität Darmstadt		Budker Institute for Nuclear Physics (BINP), Protvino
	Technische Universität Dresden		Institute for High Energy Physics (IHEP), Protvino
	Universität Frankfurt		Institute for Nuclear Research (INR) Russian Academy of Sciences, Troitsk
	GKSS-Forschungszentrum Geesthacht		Paul-Scherrer-Institut (PSI), Villigen
	Deutsches Elektronen-Synchrotron DESY in der Helmholtz-Gemeinschaft, Hamburg und Zeuthen		Argonne National Laboratory (ANL), Argonne IL
	Universität Hamburg		Fermi National Accelerator Laboratory (FNAL), Batavia IL
	Forschungszentrum Karlsruhe		Cornell University, Ithaca NJ
	Universität Rostock		University of California, Los Angeles CA
	Bergische Universität-GH Wuppertal		Jefferson Lab, Newport News VA
	CCLRC-Daresbury and Rutherford Appleton Laboratory, Cheshire		Joint Institute for Nuclear Research (JINR), Dubna
	Royal Holloway, University of London (RHUL)		
	Queen Mary, University of London (QMUL)		
	University College London (UCL)		

March 2003

Fig. 2 Masthead for "cold technology" collaboration

Important steps in this process:

1. Each of the regions has formed a steering committee to coordinate LC development activities within its region, and to prepare for the eventual global collaboration. Thus we have a ELCSC, ALCSC and USLCSC (Canada and Mexico included)
2. Formal international scientific organizations have become involved. ICFA (International Committee on Future Accelerators), a child of IUPAP (46 countries), has reconvened the TRC to examine the current situation in preparation for selection of one approach. Report now just published (show). It defines R&D accomplishments that must be completed to verify feasibility of a

particular approach. ICFA has also created an ILCSC to facilitate formation of the global collaboration (see Fig. 3) *Prevailing opinion is that we will be able to decide on the one global approach before mid '04 and to have the beginnings of a global design group in place then. Time will tell!*

Involvement of governments:

1. To date, primary involvement of regional governments has been in support of their own laboratory's efforts with little communication to other governments in a global context.
2. OECD has made some effort to get the ball rolling through its Global Science Forum which created a

Fig. 3 ICFA endorsed, grass roots linear collider coordination arrangement

"Consultative Group on High Energy Physics", a mixed group of scientists and government agency people. Their report was submitted last year and contains discussion of the science and of the possible paths to forming a global collaboration with appropriate participation by, and accountability to, governments which will participate in the hoped for project.

3. It is generally agreed that this activity should continue but that some "government only" forum needs to exist to start hammering out the many difficult challenges. Beginning initiatives are underway but path to the future not yet clear. Stay tuned.

What might a construction phase organization look like:
(see draft in Fig. 4)

Fig. 4 Possible international organization for carrying out construction of a linear collider

In the mean time - lots of technical progress in the regions.

The experts predict that we'll be able to make a technology choice within a year. With this in view, the process for creating a Global Design Group to turn the technology choice into an engineering design is now underway.

There is still a long way to go but the spirit is there for making a great advance in global scientific culture and the culture of human cooperation.

Let's make it work!
