

# **A Pilot Plant: The Fastest Path to Net Electricity from Fusion**

---

**Fusion Power Associates  
Thirty-year Anniversary Meeting and Symposium  
Rob Goldston  
December 3, 2009**

# The MFE Program Needs to Move Faster

---

## Situation

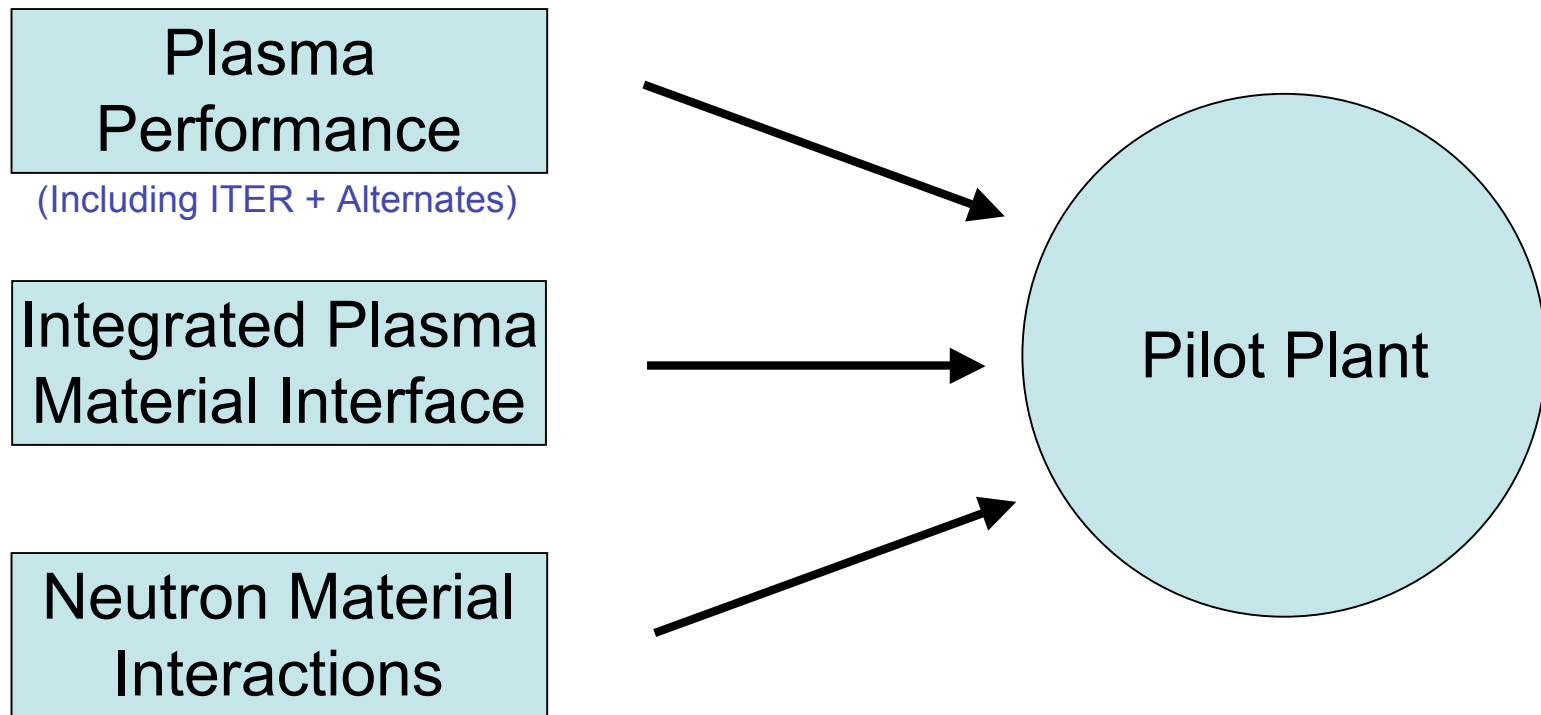

- **Need to demonstrate the practicality of MFE soon.**
- **But: ITER's earliest-case first plasma is in 2018.**  
**Earliest-case  $Q = 10$ , 300 – 500 seconds in 2028.**

## Implications

- ⇒ **Building a Component Test Facility and *then* building Demo to produce net electricity may not be the fastest path.**
- ⇒ **Consider construction of a device to make *net electricity* as soon as a technically sound design can be developed.**
  - $Q_{\text{eng}} > 1 \equiv$  “Pilot Plant”, making net electricity.
  - Pilot Plant would also perform the component testing mission.

# Three Key Science Needs for a Technically Sound MFE Pilot Plant Design

---

Themes from FESAC Priorities,  
Gaps and Opportunities Report  
(ReNeW Themes 1, 2 & 5 included  
in Plasma Performance)

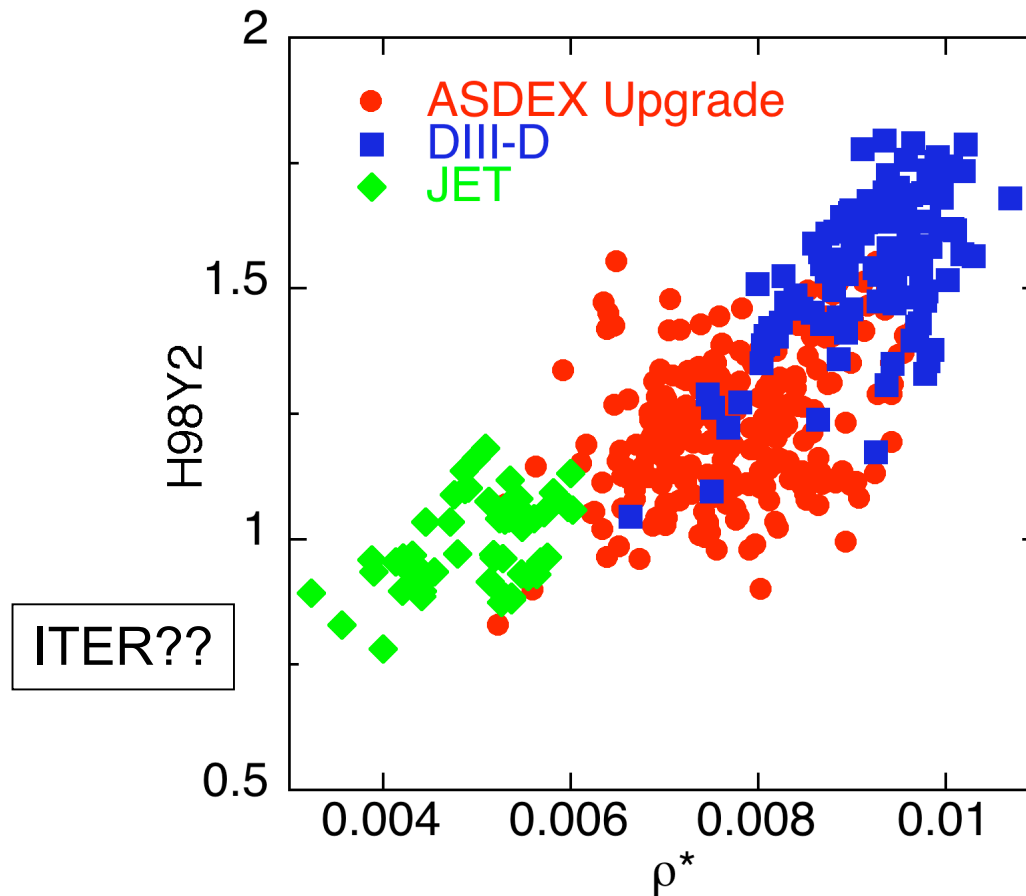

# What Science is Needed for a Technically Sound MFE Pilot Plant Design? (1)

---

## Plasma Performance

- **Scaling of confinement, operating limits and sustainment in non-inductive plasmas**
- **Confinement scaling to relevant  $\rho^*$  and  $\nu_*$**
- **Alpha heating physics**
- **Scaling information at low A**
  - Power plant maintenance most credible at low A.
- **Scaling information for stellarators**
  - Stellarators most credible for disruption avoidance, sustainment with low recirculating power
- **Are there faster/better/cheaper alternatives?**
  - ICCs

# Example: Confinement Scaling to ITER Long-Pulse “Hybrid” Mode Uncertain

**Projection to CTF, Pilot Plant or Demo is not settled.  
Latest matched DIII-D + JET results look better on these axes,  
but still do not give needed favorable “Gyro-Bohm” scaling of  $B\tau$ .**

# What Science is Needed for a Technically Sound MFE Pilot Plant Design? (2)

---

## Integrated Plasma-Materials Interface

- **High heat and particle flux and fluence**
  - What divertor designs work at needed power & duty factor?
  - What materials work at needed power & duty factor?
- **Tritium retention**
  - How to remove tritium in continuous operation?
  - All plasma-facing components (PFCs) must operate very hot.
- **Dust production**
  - How to remove dust in continuous operation?
- **Practical experience with high-pressure He-cooled PFCs**
- **Practical experience with liquid metal PFCs**
- ***Effects of ELMs and high-energy disruptions***
  - *Major issue for blanket / first wall survival in tokamaks & STs.*

**Significant synergy with many IFE concepts.**

# Pilot Plant PMI Challenges Similar to PMI Challenges Projected for CTF

---

- **Heat flux, pulse length, duty factor for Pilot Plant (PP) ~ CTF**
  - CTF: 2x ITER's heat flux      Demo: 4x ITER's heat flux
  - CTF: 2 week pulses      Demo: Few month pulses
  - CTF: 30% duty factor      Demo: up to ~70% duty factor
- **Real-time dust removal, tritium inventory control and component lifetime issues are challenging due to CTF, PP & Demo missions**
  - Must remove dust and tritium in real time: CTF, PP, Demo
  - Need to demonstrate PFC solution that allows long periods of high power operation between change-outs, including off-normal events: CTF, PP, Demo
  - ITER with few % duty factor, plans to change out divertors after ~ 0.08 full-power years – at much lower power density.
- **Many solutions used on ITER are not CTF, PP or Demo relevant.**
  - Beryllium first wall
  - Stainless-steel vacuum vessel
  - Water cooled ~200C PFCs
  - Intermittent dust collection and tritium clean-up

**CTF, PP or Demo: All Would Need New PMI Solutions.**

# What Science is Needed for a Technically Sound MFE Pilot Plant Design ? (3)

---

- **A strong blanket technology program is required for CTF, PP or Demo.**
- **Design of CTF, PP or Demo would be informed by a powerful point neutron source such as IFMIF (or MTS?). For example:**
  - Vacuum vessel design depends on properties of hot main blankets: electrical conduction paths, structural integrity, size, services (coolant, T purge fluid).
  - Hot main blanket design depends on material properties w/14 MeV neutrons.
  - Same logic holds for many other components, *e.g.*, divertors, antennas.
  - Point neutron source needed to develop materials for test blankets.
- **Tritium breeding uncertainties can be mitigated by Li isotopic mix.**
  - Tritium cycle can be confirmed in Pilot Plant.

- **ReNeW on this topic:**

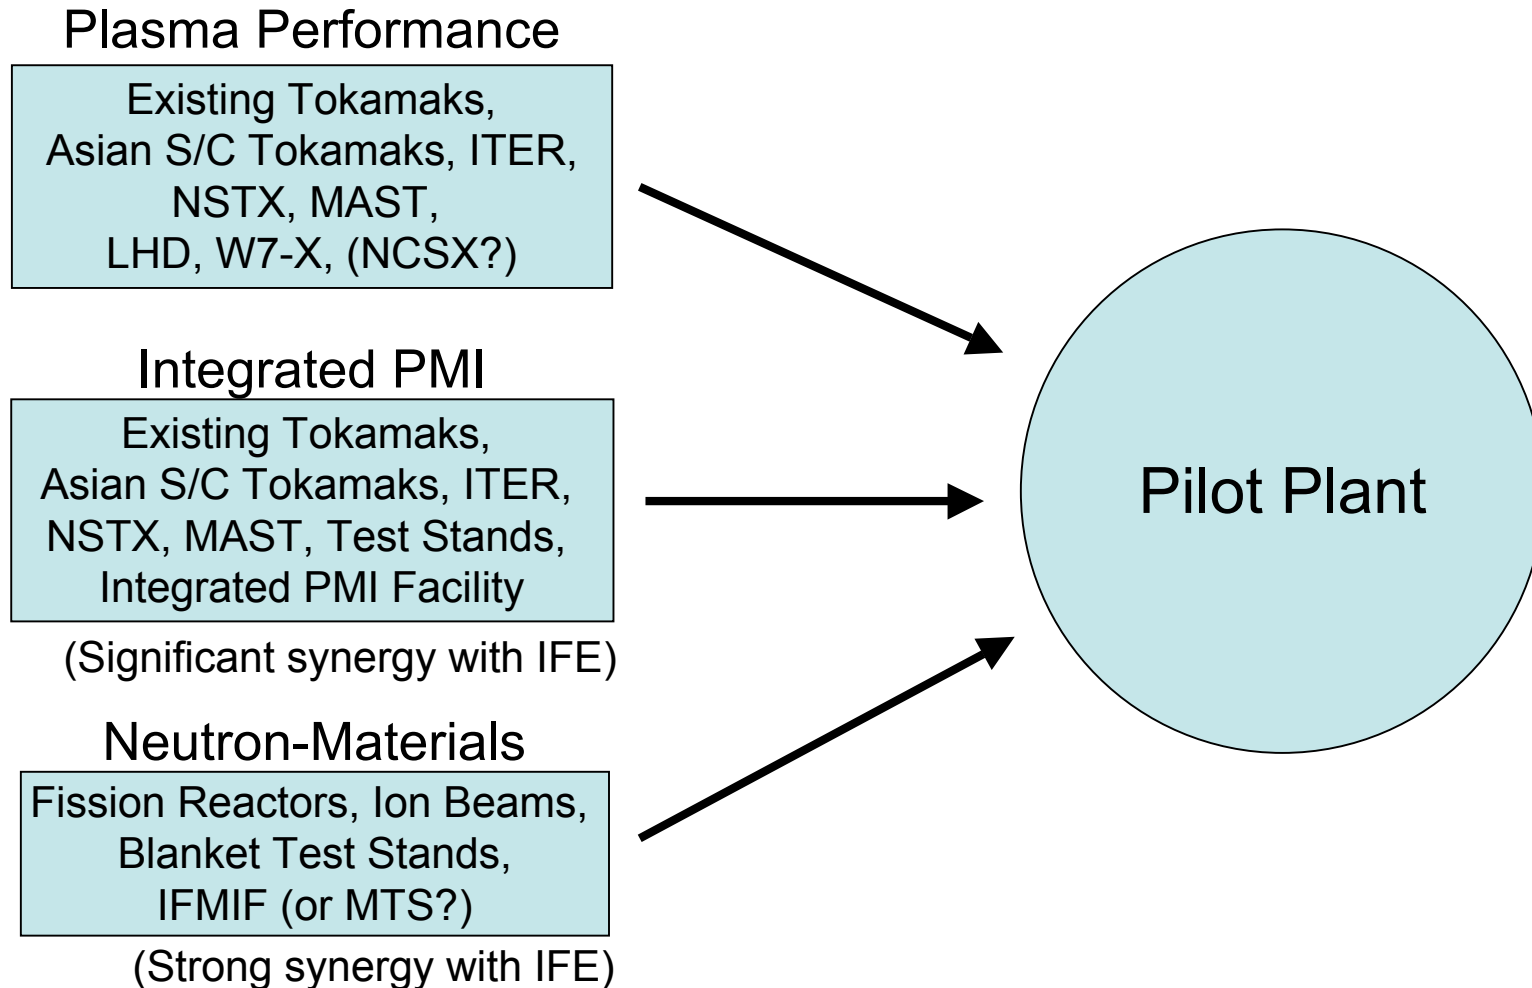

A later possibility might be to include a provision for materials irradiation capabilities as part of a large-scale nuclear facility such as the proposed Fusion Nuclear Science Facility. However, it must be emphasized that bulk material property data from a fusion relevant neutron source would inform the design, construction and licensing of such facilities.

**A point neutron source has high synergy with many IFE concepts.**

# Facilities to Contribute to a Technically Sound MFE Pilot Plant Design

---

# Roles of Major Facilities

---

- **Plasma Performance**

- ITER for  $\rho^*$  scaling,  $\alpha$ -particle heating
- Existing tokamaks, Asian S/C tokamaks for AT pilot plant option
- LHD, W7-X, (NCSX?) at relevant  $\beta$  and  $v_*$  for stellarator pilot plant option
- NSTX, MAST at relevant  $\beta$  and  $v_*$  for low aspect ratio pilot plant option

- **Integrated Plasma-Material Interface**

- Existing tokamaks, Asian S/C tokamaks, NSTX-U, MAST, test stands, for initial tests of new PFC geometries and materials.
- ITER for effects of high-energy ELMs and disruptions.
- Long-pulse, hot walls, high-heat-flux DD confinement facility for integrated power and particle handling studies. Develops solutions for divertor lifetime, tritium retention, dust clean-up, long-pulse disruption avoidance.

- **Neutron Material Interactions**

- Fission reactors, ion beams to sieve candidate materials.
- Blanket test stands to develop required technologies.
- IFMIF (or MTS?) with correct He/dpa to investigate materials physics at high fluence; qualify materials to be used in PP design, then test blankets.

# Is a Pilot Plant Smaller than a Demo?

---

- Assume conservatively that recirculating power,  $P_{rec}$ , is constant from Pilot Plant (PP) to Demo
- Assume recirculating fraction in Demo is 20%;  $Q_{eng} = 5$
- Assume Pilot Plant  $Q_{eng} = 1.2$
- $P_{e,gross,Demo} = 5 P_{rec}$  ;  $P_{e,gross,PP} = 1.2 P_{rec}$
- $P_{e,gross,PP} = 0.24 P_{e,gross,Demo}$
- Assume Demo-level B &  $\beta \Rightarrow R^3 \propto P_{fus} \propto P_{e,gross}$   
*Assume adequate confinement*
- $P_{fus,PP} = 0.24 P_{fus,Demo}$ ;  $R_{PP} = 0.62 R_{Demo}$
- Neutron wall loading in Pilot Plant = 0.62 Demo neutron wall loading

**Obviously there are other factors (e.g., neutron m.f.p.).  
On the other hand  $P_{rec} = \text{constant}$  is conservative.  
Initial looks at Tokamak, ST, Stellarator support  $R_{PP} \sim 0.6 R_{Demo}$**

# Spreadsheet Pilot Plants Assuming High Confinement are Encouraging

---

- **Tokamak**

- $R/a = 4.0\text{m}/1.0\text{m}$ ,  $B_0 = 6\text{T}$ ,  $I_p = 8\text{MA}$
- $H_H = 1.5$ ,  $P_{\text{fus}} = 520\text{MW}$ ,  $Q_p = 10$ ,  $Q_{\text{eng}} \sim 1$

- **ST**

- $R/a = 1.5\text{m}/0.9\text{m}$ ,  $B_0 = 2.2\text{T}$ ,  $I_p = 15\text{MA}$
- $H_H = 1.7$ ,  $P_{\text{fus}} = 500\text{MW}$ ,  $Q_p = 25$ ,  $Q_{\text{eng}} \sim 1$

- **Stellarator**

- $R/\langle a \rangle = 4.5\text{m}/1.0\text{m}$ ,  $B_0 = 5.7\text{T}$
- $H_{\text{ISS04}} = 2$ ,  $P_{\text{fus}} = 470\text{MW}$ ,  $Q_p = 40$ ,  $Q_{\text{eng}} \sim 4$

**These spreadsheet analyses are only very first looks.  
Engineering scaled simply from ARIES studies.**

# Much More Analysis is Required

---

- **What would an MFE Pilot Plant look like?**

- Advanced Tokamak (Superconducting for  $Q_{eng} > 1$ )
- Spherical Torus (Most readily maintained configuration)
- Stellarator (Lowest recirculating power, no disruptions)

*Any design should prototype Demo maintenance approach.*

- **What near-term program of Modeling, Test Stand R&D, New Facilities is necessary to support a Pilot Plant?**

- Plasma performance
- Integrated plasma material interface
- Neutron interactive materials

# A Pilot Plant is an Exciting Goal

---

- **We can explain it to our sponsors and the public**
  - We have a plan to make net electricity soon.
  - This will put fusion “on the map” as an energy option.
- **It would culminate the key FESAC Themes**
  - Creating Predictable High-Performance Steady-State Plasmas
  - Taming the Plasma-Material Interface
  - Harnessing Fusion Power
- **ARIES + Fusion Community Pilot Plant Study?**
  - What would a tokamak, ST or stellarator Pilot Plant look like?
  - What supporting program is needed for a technically sound design?
  - A similar IFE Pilot Plant study should be carried out in parallel.
